

# ROAD COAT

## ASPHALT PENETRATOR DUST PALLIATIVE

**ROAD COAT** is an economical, effective dust control. It is long lasting because it is asphalt base and sheds water. Magnesium and Calcium Chloride both draw water into the application to keep the dust controlled. **ROAD COAT** seals and binds the road together and repels water away from the application.

**ROAD COAT** is designed to penetrate rapidly and absorb into the surface binding the fines together and waterproofing the treated areas to make them resistant to water erosion. The product will continue to provide protection from wind, water, and traffic erosion for an extended period of time.

**ROAD COAT** delivers the long lasting binding abilities of high-grade asphalt. Water proofing and better wet weather road stability is also included in the package.

Before applying **ROAD COAT**, the road should be graded to prevent puddling and to eliminate potholes. This will allow **ROAD COAT** to penetrate the surface more effectively.
